01 HYDRAULIC FLUIDS

K4VSG pump is design for operation with [DIN 51524] HLP mineral oil. Selection of environmentally acceptable hydraulic fluids, or fire-resistant, water-free hydraulic fluids HFD, or fire-resistant, water-containing hydraulic fluids HFA/HFB/HFC is allowed but must be specified when ordering.

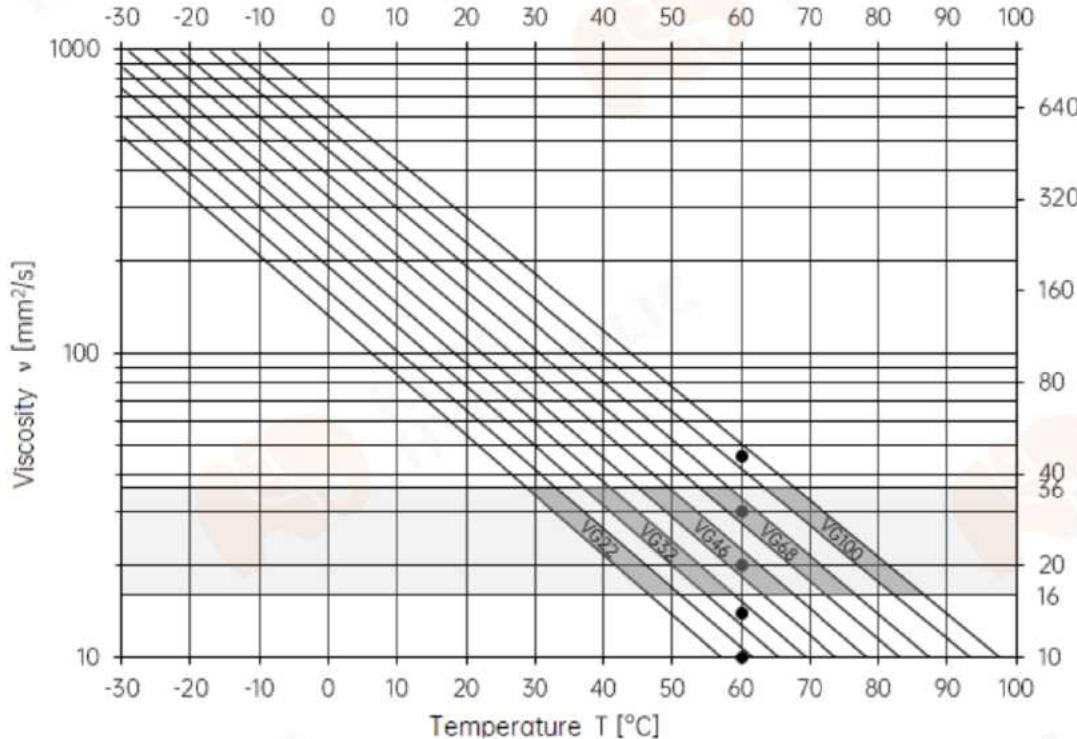

Please contact us if any technical parameter cannot be adhered to.

1. Viscosity and temperature of hydraulic fluids

Operation	Temperature	Viscosity	Remarks
Cold start	$t_{\min} = -25^{\circ}\text{C}/-40^{\circ}\text{C}^*$	$v_{\max} = 1600 \text{ mm}^2/\text{s}$	$t < 3 \text{ min}, p \leq 50 \text{ bar}, n \leq 1000 \text{ rpm}$
Warm-up		$v = 400 \sim 1600 \text{ mm}^2/\text{s}$	$t \leq 15 \text{ min}, p \leq 0.7 p_N, n \leq 0.5 n_{\max}$
Continuous	$t_{\max} = +110^{\circ}\text{C}/+85^{\circ}\text{C}^*$	$v = 10 \sim 400 \text{ mm}^2/\text{s}$	at port T
Short-term	$t_{\max} = +110^{\circ}\text{C}/+85^{\circ}\text{C}^*$	$v_{\min} = 7 \sim 10 \text{ mm}^2/\text{s}$	$t < 3 \text{ min}, p \leq 0.3 p_N, \text{ at port T}$

NOTE: * NBR as shaft seals, please contact us.

2. Selection diagram

Before selection, figure out the relationship between ambient temperature and oil temperature in lines in a close circuit. Make sure that any temperature in system must NOT exceed 110 °C.

The hydraulic fluid should be selected so that the operating viscosity in the operating temperature range is within the optimum range $v_{\text{opt}} = 16 \sim 36 \text{ mm}^2/\text{s}$ (shaded area in selection diagram) and its viscosity grade should be as high as possible. For example: whereat oil temperature in reservoir is 60 °C, both viscosity grades VG46 and VG68 are within the optimum range (2 spots in shaded area of selection diagram), in this case, VG68 is preferred.

3. Filtration of hydraulic fluids

Finer filtration improves the cleanliness level of the hydraulic fluid, which increases the service life of the axial piston unit. An [ISO 4406] cleanliness level of at least 20/18/15 is to be maintained during continuous operation; In case of high temperature (90~115 °C) during short-term operation, cleanliness level of 19/17/14 is required.

4. Bearing flushing

Bearing flushing is required for a safe, continuous operation for the following operating conditions:

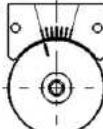

- Operation with borderline conditions for temperature and viscosity during operation with mineral oil;
- Application with special fluids (non-mineral fluids) due to limited lubricity and narrow operating temperature range;
- Recommended for lubricating the front bearing and the shaft sealing, with vertical installation and shaft upwards.

Bearing flushing is realized at port U in the area of front flange of the variable pump. The flushing fluid flows through the front bearing and discharges with the pump drain at the drain port T. Depending on individual sizes, the following flushing flows are recommended:

Size	40	71	125	180	250	355	500	750	1000
	3	4	5	7	10	15	20	30	40

02 TECHNICAL DATA

1. Flow direction (from the inlet port to the outlet port, either A or B)

DIRECTION OF ROTATION	Indicator to the left	← Swivel angle ±15° →	Indicator to the right
clockwise R	A→B		B→A
counterclockwise L	B→A		A→B

For example, when the indicator of a clockwise rotated pump R swivels to the left, flow direction is A→B, i.e. port A is the inlet and port B is the outlet.

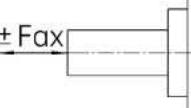

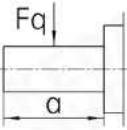

2. Working pressure range (when using hydraulic fluid based on mineral oils)

Pressure	K4VSG		Remarks
Boost/Inlet p_{sp}	16 bar 25 bar (size 500~1000 or EO2)	Minimum pressure 0.7 bar at the low-pressure side (inlet) is required to prevent damage to the axial piston unit.	
Nominal p_N	350 bar	At the high-pressure side (outlet) corresponds to the maximum design pressure.	
Maximum p_{max}	400 bar	At the high-pressure side (outlet) corresponds to the maximum working pressure within a single operating period.	
Minimum p_{min}	15 bar	Minimum pressure at the high-pressure side (outlet) is required to prevent damage to the axial piston unit.	
Case p_L	$\bar{p}_L \leq 2$ bar $p_{L,max} = 4$ bar	Case pressures at port K ₂ /K ₃ /R(L) must be greater than the ambient pressure at shaft seals.

		$F_{q, \max}$ N										

NOTE: 1) $\Delta p_N = 350$ bar; 2) $\Delta p_E = 100$ bar.

4. Determination of characteristics

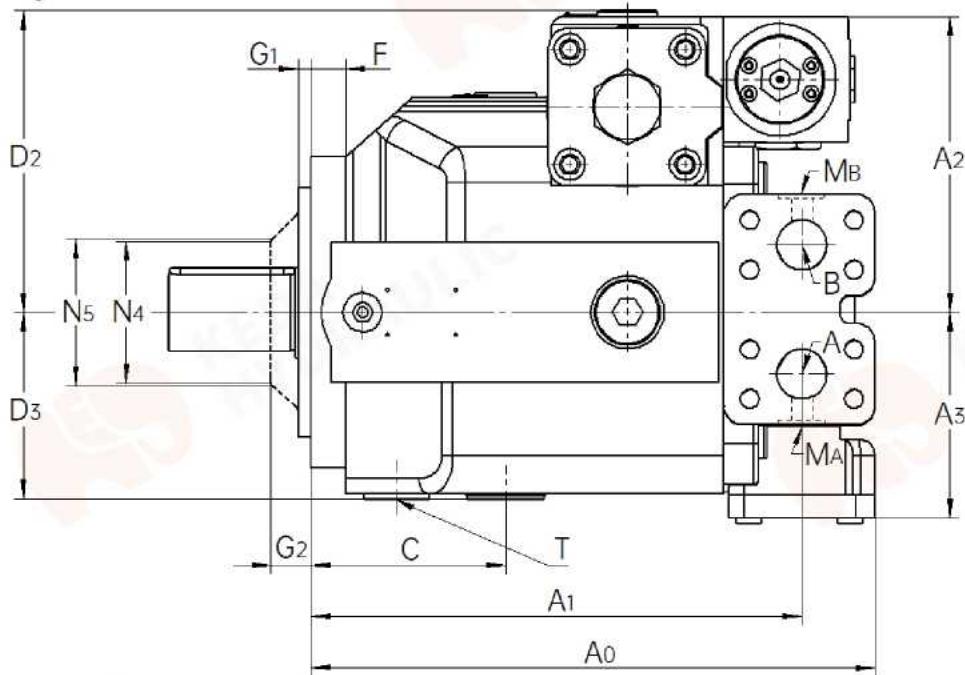

Operation above the maximum values or below the minimum values may result in loss of function, reduced service life or destruction of the axial piston unit. Check out all the permissible values by means of following calculation, etc.

Parameter	Formula			Unit
Geometric displacement per revolution	q_V			[mL/r]
Differential pressure	$\Delta p = p - p_{sp}$			[bar]
Rotational speed	n			[rpm]
Volumetric efficiency	$\eta_V = \frac{Q_V}{Q_{V, \text{theor}}}$			[%]
Hydraulic-mechanical efficiency	η_{mh}			[%]
Total efficiency	$\eta_t = \frac{Q_V \times p}{600 \times P_{Q_V, \max}} = \eta_V \times \eta_{mh}$			[%]
Flow	$Q_V = \frac{q_V \times n \times \eta_V}{1000}$			[L/min]
Torque	$T = \frac{q_V \times \Delta p}{20 \pi \times \eta_{mh}}$			[Nm]
Power	$P = \frac{2\pi \times T \times n}{60000} = \frac{Q_V \times \Delta p}{600 \times \eta_t}$			[kW]

05 CONTROL DEVICE

K4VSG pumps can be equipped with various control devices, such as manual control MA, pressure control DR, hyperbolic power control LR2, pilot-pressure related hydraulic control HD, control volume dependent hydraulic control HM, hydraulic control with proportional valve HS4, electric control EO2 and so forth.

1. MA – Manual control

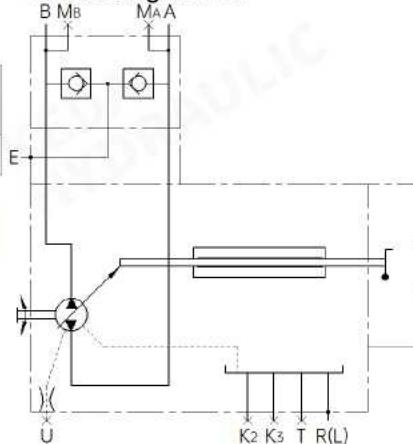

Infinite adjustment of displacement by means of a hand-wheel.

▼ Availability for MA control of all sizes

Control	Size	40	71	125	180	250	355	500	750	1000
MA	●	○	●	○	●	●	○	○	-	

NOTE: ● available; ○ upon request; - unavailable.

▼ Circuit diagram MA

2. DR – Pressure control

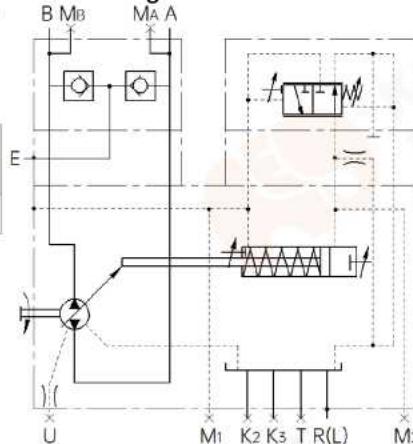

The pressure controller DR limits the maximum pressure p_{max} at pump outlet within the control range 50~350 bar (default 350 bar) of variable pump. NOT available for bidirectional rotated pump W.

▼ Availability for DR control of all sizes

Control	Size	40	71	125	180	250	355	500	750	1000
DR	●	○	●	○	●	●	●	-	-	-

NOTE: ● available; ○ upon request; - unavailable.

▼ Circuit diagram DR

3. LR2 – Hyperbolic power control

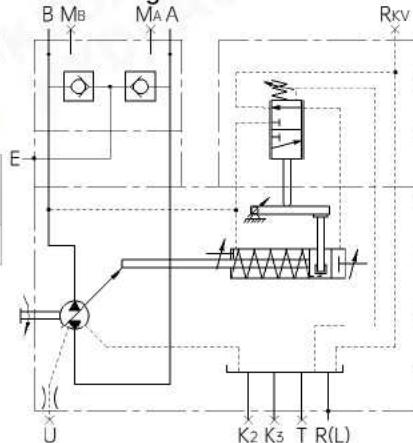

The power controller LR2 adjusts the displacement of the pump according to working pressure, keeps specified drive power constant at same drive speed, whereby the power characteristic is hyperbolic. NOT available for bidirectional rotated pump W.

▼ Availability for LR2 control of all sizes

Control	Size	40	71	125	180	250	355	500	750	1000
LR2	●	○	●	○	●	●	○	-	-	-

NOTE: ● available; ○ upon request; - unavailable.

▼ Circuit diagram LR2

4. HD – Pilot-pressure related hydraulic control

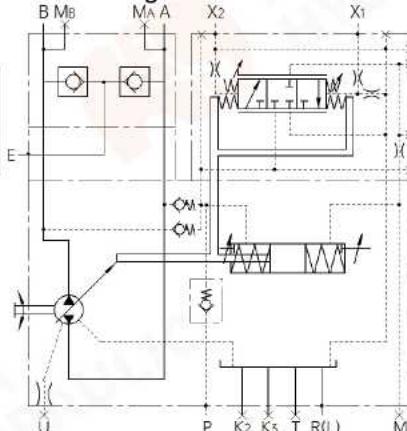

Infinite adjustment of displacement proportional to specified pilot-pressure.

▼ Availability for HD control of all sizes

Control	Size	40	71	125	180	250	355	500	750	1000
HD		○	○	○	○	○	○	●	●	-

NOTE: ● available; ○ upon request; - unavailable.

▼ Circuit diagram HD

5. HM – Control volume dependent hydraulic control

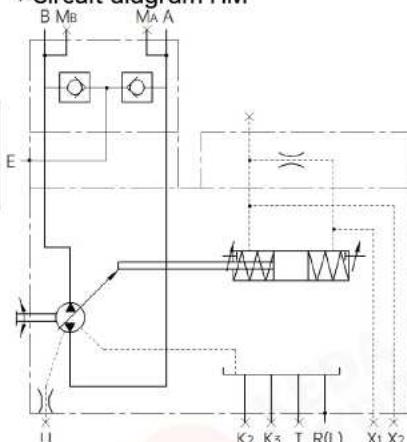

The pump displacement can be infinitely varied in relation to the control oil volume in ports X₁ and X₂. Can be applied in two-point circuit or servo control.

▼ Availability for HM control of all sizes

Control	Size	40	71	125	180	250	355	500	750	1000
HM		○	○	○	○	○	○	○	-	-

NOTE: ○ upon request; - unavailable.

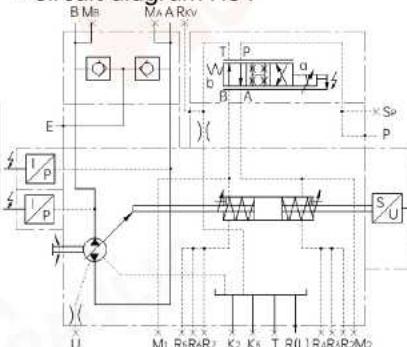

▼ Circuit diagram HM

6. HS4 – Hydraulic control with proportional valve

Infinite adjustment of displacement by means of a proportional valve and electrical feedback of the swivel angle.

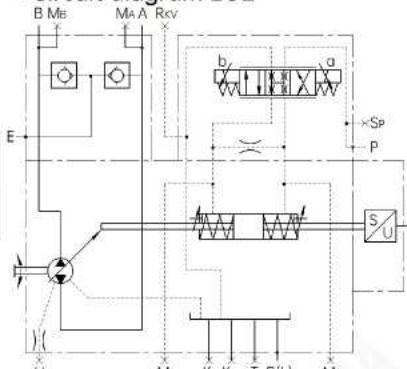

▼ Circuit diagram HS4

7. EO2 – Electric control

Infinite adjustment of displacement by means of a proportional valve and electrical feedback of the swivel angle. The control can be used as an electric displacement control.

▼ Circuit diagram EO2

▼ Availability for EO2 control of all sizes

Control	Size	40	71	125	180	250	355	500	750	1000
EO2		●	○	●	○	●	●	●	●	-

NOTE: ● available; ○ upon request; - unavailable.

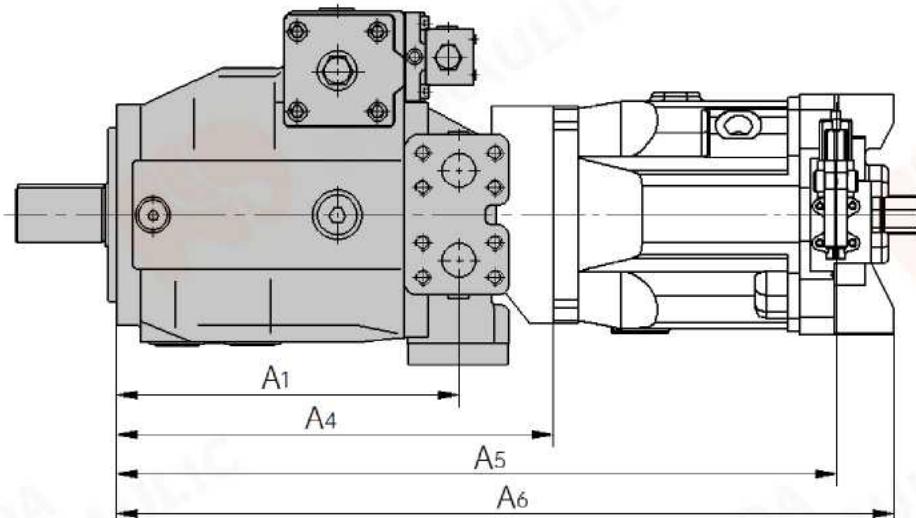

COMBINATION PUMP

K4VSG pump can be combined with K10VO, K4VSO, K4VSG or other type of pumps. A tandem pump with two pumps of equal size is permissible. Please specify the designations for the 1st and the 2nd pumps and join by a "+" when ordering. Order example:

K4VS G 250 LR2 /10 R - P P B 13 K34 0 Z + K4VS G 125 DR /10 R - P P B 13 N00 0 N

The first row of following table refers to the 1st pump (P). For informations about the through-drives (TD), see part 12.

4. For dimensions of K4VSG+other type of pumps, such as a gear pump or radial piston pump, please contact us for further information before ordering.

12 THROUGH-DRIVE

K4VSG pump can be combined with K10VO, K4VSO, K4VSG or other type of pumps. Hub for splined shaft, mounting bolts, O-rings and mounting plates (when available) are in the scope of delivery.

The first rows of following tables refer to the 1st pumps, while the second rows after "+" refer to the 2nd pumps and their drive shafts.

COUPLING ASSEMBLY

1. Install the specified coupling half onto the drive shaft of the axial piston unit following instructions.
2. Clamp the coupling hub onto the drive shaft or ensure a permanent lubrication of the drive shaft. This prevents the formation of frictional corrosion and the associated wear.
3. Transport the axial piston unit to the installation location and remove dirt and contaminants there.
4. Install the coupling on the drive shaft of the machine/system in accordance with the specifications. Fix the axial piston unit (may not be bolted down until the coupling has been correctly installed).
5. Do not install the coupling hub onto the drive shaft of the axial piston unit by striking it.

TRANSPORTATION

▲via lifting strap

▲via hooks

▲via forklift
